In chemistry, a colloid is a phase separated mixture in which one substance of microscopically dispersed insoluble or soluble particles is suspended throughout another substance. Sometimes the dispersed substance alone is called the colloid; the term colloidal suspension refers unambiguously to the overall mixture. Unlike a solution, whose solute and solvent constitute only one phase, a colloid has a dispersed phase and a continuous phase that arise by phase separation. Typically, colloids do no

Resuscitation of shock involves the optimisation of preload, in which intravascular volume is an important factor. Colloids such as gelatin, albumin and starch tend to stay in the intravascular space because these larger molecules are slower to diffuse into the extravascular space.
