To understand a 4-conductor pickup, we must first study a single-coil pickup since a humbucker is simply two single-coils combined as one pickup. A single-coil is comprised of three primary components: magnet (s), the coil that has a "start" and a "finish" and the bobbin. Think of a single-coil as a 2-conductor pickup—the start and the finish.

Understanding Guitar Wiring | stewartmac.com

Every pickup company uses its own color-code scheme for these four wires. This makes discussing humbucker wiring a little more confusing than necessary, but that's the way it is. As usual, I'll use the Seymour Duncan color code as a quasi-standard.

When wiring two pickups in parallel, each pickup loses 3/4 of its output when combined with the other. This drops each pickup's output to 25 x, instead of 100 x. Together, you get a total of 50 x (25 x + 25 x). This power drop is why any dual-pickup combination on your Strat doesn't sound as loud as a single pickup.

Guitar Wiring: Series vs. Parallel Explained

The four colored wires are called "conductor" wires because each of them carries current to and from the two coils in the humbucker. Each coil has a positive and a negative wire. The color that goes to each is called the pickup's "Wiring Code." Unfortunately, there is no standard Wiring Code, and it varies between manufacturers.
